

Sustainably operate any size of video conferencing service

VQ Conference Manager enables your operations team to oversee high call volumes, with alerts to inform them when things go wrong

Support large call volumes

Sustainably grow your video conferencing service without constantly increasing the size of your operations team

VQ Conference Manager's operator dashboard allows your operations team needs to deliver a reliable video conferencing service and support large numbers of calls.

Insights at your operators' fingertips

Operators can view active calls they're responsible for, across one or more Cisco Meeting Servers

They can also search for calls and pin high-priority meetings so they're always visible. Alerts assist operators to proactively triage calls.

View and control calls

For each call and its participants, operators get real-time information on video layout, bandwidth use, device types and more

They can add participants quickly, with Google-style instant auto-complete, remove participants, mute and unmute participant audio and change the video layout.

Custom dashboards

As well as the main operator view, VQ Conference Manager enables you to create bespoke dashboards

These can be configured to show a variety of data relating to your system, calls, network and individual Cisco Meeting Server licensing consumption and status.

Manage Spaces

Spaces are the virtual meeting rooms in which your calls take place

Without VQ Conference Manager, managing Spaces can quickly become complex. Our tools to create and administer Spaces make things much simpler, while a set of ready-to-use templates helps you get started quickly.
